

The chart displays wave height in meters on the y-axis (0 to 10) against time on the x-axis (April 4 to April 14). A red vertical line at April 5 indicates the start of the 'Noise' period. The legend indicates that the green bars represent 'Excellent' forecast accuracy, purple bars represent 'Very Good', blue bars represent 'Good', yellow bars represent 'Poor', red bars represent 'Noise', and black bars represent 'Unknown'. The wave height peaks around April 6 at approximately 8.5m and then generally decreases, with a notable dip around April 10 where it drops to near 0m. The forecast accuracy is mostly 'Excellent' (green) until the 'Noise' period begins, after which it becomes more varied, including 'Very Good' (purple) and 'Good' (blue) periods.
