

Figure 1 displays two time series plots from May 24 to June 8. The top plot shows Wind Speed in knots (kts) on the y-axis (0 to 30) against time on the x-axis. The bottom plot shows Wave Height in feet (ft) on the y-axis (0 to 20) against time on the x-axis. Both plots have a common x-axis with labels for days of the week and dates. A red vertical line is drawn at the start of the time series (May 24). Arrows at the top of each chart indicate the direction of the wind or wave. The wind speed shows several peaks, with the highest peak around May 29. The wave height shows a significant peak around May 30 and another around June 1.
